

Current Claims Schedule

- 1 1. (Original) Apparatus for performing a transesophageal cardiovascular procedure,
2 said apparatus comprising
3 an elongated tubular main access device having a first lumen with an open proxi-
4 mal end and a distal side opening;
5 inflatable sealing means on the outside of said device above and below said side
6 opening, and
7 a first fluid conduit extending along said device for inflating said sealing means
8 so that when the device is inserted into a patient's esophagus and the sealing means are
9 inflated, the portion of the esophagus opposite said side opening is isolated from the re-
10 mainder of the esophagus above and below the side opening.
- 1 2. (Original) The apparatus defined in claim 1 and further including
2 a second fluid conduit extending along said device, said second conduit having a
3 proximal end for connection to a vacuum source and a distal end which opens adjacent to
4 said side opening so that fluid may be sucked from the isolated portion of the esophagus.
- 1 3. (Original) The apparatus defined in claim 1
2 wherein said device has a second lumen with a rigid outer wall and a collapsible
3 inner wall, said second lumen adapted to receive an elongated probe or surgical device,
4 and
5 further including means for introducing a fluid between said inner and outer walls
6 to collapse the inner wall against the probe or surgical device.
- 1 4. (Original) The apparatus defined in claim 1 and further including
2 perforate fluid channels formed in the outside of said device above and below said
3 side opening, and
4 means extending along the device for conducting fluid to and/or from said chan-
5 nels.

- 1 5. (Original) The apparatus defined in claim 1 and further including a side access unit
2 comprising
3 elongated flexible coaxial inner and outer tubes said tubes having proximal and
4 distal ends and being moveable relatively in the axial direction and said inner tube having
5 at least one lumen extending between said ends;
6 second sealing means mounted to the distal end of the outer tube;
7 third sealing means mounted to the distal end of the inner tube, and
8 means adjacent to the proximal ends of said tubes for moving said tubes relatively
9 so as to vary the axial spacing of said second and third said sealing means.
- 1 6. (Original) The apparatus defined in claim 5 wherein the second and third sealing
2 means comprise balloons or flanges.
- 1 7. (Original) The apparatus defined in claim 5 wherein the second sealing means com-
2 prise
3 a plurality of flexible, axially extending flaps mounted to the distal end of the
4 outer tube, said flaps being movable between a collapsed position wherein the flaps are
5 nested against the outer tube and an extended position wherein the flaps project radially
6 out from the other tube, and
7 means for moving the flaps between said collapsed and extended positions.
- 1 8. (Original) The apparatus defined in claim 7 wherein the moving means comprise
2 elongated needles extending from the proximal end of the outer tube into said
3 flaps, the segments of said needles in said flaps being curved so that rotation of said nee-
4 dles about their respective axes moves the flaps between said collapsed and extended po-
5 sitions, and
6 means at said proximal end of the inner tube for rotating said needles about their
7 respective axes.

1 9. (Original) The apparatus defined in claim 7 and further including cooperating means
2 on the distal ends of said first and second tubes for forming a purse string suture.

1 10. (Original) The apparatus defined in claim 5 wherein said third sealing means com-
2 prise

3 an umbrella mounted to the outside of the inner tube, said umbrella being move-
4 able between a retracted position wherein the umbrella nests against the inner tube within
5 the outer tube and an extended position wherein the umbrella extends radially out from
6 the inner tube beyond the distal end of the outer tube, and

7 means for moving the umbrella between its retracted and extended positions.

1 11. (Original) Apparatus for performing a transesophageal cardiovascular procedure,
2 said apparatus comprising

3 an elongated flexible tubular shaft having a proximal end, a distal end and a wall
4 extending between said ends;

5 a first lumen extending along the shaft, said lumen having an open proximal end
6 near the proximal end of the shaft and an open distal end constituted by a side opening in
7 the wall of the shaft near the distal end of the shaft;

8 first expandable sealing means on the side wall of the shaft and extending above
9 and below said side opening;

10 expanding means extending along the shaft for expanding said first sealing means
11 so that when the shaft is inserted into a patient's esophagus and the first sealing means are
12 expanded, the portion of the esophagus opposite the side opening is isolated from the re-
13 mainder of the esophagus above and below the side opening;

14 a fiber optic endoscope extending along the shaft said endoscope having a proxi-
15 mal end adapted for connection to a light source and a distal end located adjacent to said
16 side opening for viewing the portion of the esophagus opposite the side opening;

17 an ultrasound transducer in said shaft near the distal end thereof, and

18 conductors extending along the shaft for connecting the transducer to an ultra-
19 sound transceiver.

1 12. (Original) The apparatus defined in claim 11 wherein the first sealing means com-
2 prise at least one inflatable balloon and the expanding means include a first fluid conduit
3 for conducting an inflation fluid to and from said at least one balloon.

1 13. (Original) The apparatus defined in claim 12 and further including at least one vac-
2 uum port in the shaft wall adjacent to said side opening, and
3 a second conduit extending along the shaft, said second conduit having a proximal
4 end for connection to a vacuum source and being in fluid communication with said at
5 least one vacuum port so that a vacuum can be drawn in the isolated portion of the
6 esophagus.

1 14. (Original) The apparatus defined in claim 13 and further including additional vacuum
2 ports in the shaft wall spaced above and below said at least one vacuum port, said second
3 conduit also being in fluid communication with said additional vacuum ports.

1 15. (Original) The apparatus defined in claim 11 and further including a light source
2 connected to the proximal end of the endoscope and an ultrasound transceiver connected
3 to said conductors.

1 16. (Original) The apparatus defined in claim 11 wherein said first lumen transitions
2 gradually to said side opening.

1 17. (Original) The apparatus defined in claim 11 and further including an elongated
2 probe or surgical device received in said first lumen said probe or surgical device having
3 a working end which is deployable from said side opening.

1 18. (Previously Presented) Apparatus for performing a transesophageal procedure, said
2 apparatus comprising

3 an elongated tubular access device having a proximal end, a distal end and a wall
4 extending between said ends;

5 a first lumen extending along the device, said first lumen having an open proximal
6 end and an open distal end constituted by a side opening the wall of the device near the
7 distal end;

8 expandable sealing means on the outside of said device and extending above and
9 below said side opening, and

10 expanding means extending along said device for expanding said sealing means
11 so that when the device is inserted into said esophagus and the sealing means are ex-
12 panded, the portion of the esophagus opposite said side opening is isolated from the re-
13 mainder of the tract above and below the side opening.

1 19. (Previously Presented) The apparatus defined in claim 18 wherein the length of the
2 device is such that said side opening may be located in the esophagus opposite the heart
3 of said patient.

1 20. (Previously Presented) The apparatus defined in claim 18 and further including
2 a second lumen extending along said device, said second lumen having a proxi-
3 mal end for connection to a vacuum source and a distal end which opens adjacent to said
4 side opening so that fluid may be sucked from said isolated portion of the esophagus.

1 21. (Previously Presented) The apparatus defined in claim 18 and further including
2 a second lumen having a rigid outer wall and a collapsible inner wall, said second
3 lumen being adapted to slidably receive an elongated probe or surgical device, and
4 means for introducing a fluid between said inner and outer walls to collapse the
5 inner wall against the probe or surgical device received in the second lumen.

1 22. (Previously Presented) The apparatus defined in claim 18 and further including
2 perforate fluid channels formed in the outside of said device above and below said
3 side opening, and

4 conduit means extending along the device for conducting fluid to and/or from said
5 channels.

1 23. (Previously Presented) The apparatus defined in claim 18 and further including a
2 side access unit comprising

3 elongated flexible coaxial inner and outer tubes said tubes having proximal and
4 distal ends and being movable relatively in the axial direction and said inner tube having
5 at least one lumen extending between said ends;

6 second sealing means mounted to the distal end of the outer tube;

7 third sealing means mounted to the distal end of the inner tube, and

8 means adjacent to the proximal ends of said tubes for moving said tubes relatively
9 so as to vary the axial spacing of said second and third sealing means.

1 24. (Previously Presented) The apparatus defined in claim 23 wherein the second and
2 third sealing means comprise balloons or flanges.

1 25. (Previously Presented) The apparatus defined in claim 23 wherein the second seal-
2 ing means comprise

3 a plurality of flexible, axially extending flaps mounted to the distal end of the
4 outer tube, said flaps being movable between a collapsed position wherein the flaps are
5 nested against the outer tube and an extended position wherein the flaps project radially
6 out from the outer tube, and

7 means for moving the flaps between said collapsed and extended positions.

1 26. (Previously Presented) The apparatus defined in claim 25 wherein the moving
2 means comprise

3 elongated needles extending from the proximal end of the outer tube into said
4 flaps, said needles having segments in said flaps which are offset so that rotation of said
5 needles moves the flaps between said collapsed and extended positions, and

6 means at said proximal end of the inner tube for rotating said needles.

1 27. (Previously Presented) The apparatus defined in claim 25 and further including
2 cooperating means on the distal ends of said first and second tubes for forming a purse
3 string suture.

1 28. (Previously Presented) The apparatus defined in claim 23 wherein said third seal-
2 ing means comprise

3 an umbrella mounted to the outside of the inner tube, said umbrella being move-
4 able between a retracted position wherein the umbrella nests against the inner tube within
5 the outer tube and an extended position wherein the umbrella extends radially out from
6 the inner tube beyond the distal end of the outer tube, and

7 means for moving the umbrella between its retracted and extended positions.

1 29. (Previously Presented) Apparatus for performing a transesophageal procedure, said
2 apparatus comprising

3 an elongated flexible tubular shaft having a proximal end, a distal end and a wall
4 extending between said ends;

5 a first lumen extending along the shaft, said lumen having an open proximal end
6 near the proximal end of the shaft and an open distal end near the distal end of the shaft;

7 first expandable sealing means on the side wall of the shaft and extending above
8 and below said opening;

9 expanding means extending along the shaft for expanding said first sealing means
10 so that when the shaft is inserted into said esophagus and the first sealing means are ex-
11 panded, a portion of the esophagus opposite the opening is isolated from the remainder of
12 the esophagus above and below the opening;

13 a fiberoptic endoscope extending along the shaft said endoscope having a proxi-
14 mal end adapted for connection to a light source and a distal end located adjacent to said
15 opening for viewing the portion of said esophagus opposite the opening;

16 an ultrasound transducer in said shaft near the distal end thereof, and

17 conductors extending along the shaft for connecting the transducer to an ultra-
18 sound transceiver.

1 30. (Previously Presented) The apparatus defined in claim 29 wherein the first sealing
2 means comprise at least one inflatable balloon and the expanding means include a first
3 fluid conduit for conducting an inflation fluid to and from said at least one balloon.

1 31. (Previously Presented) The apparatus defined in claim 30 and further including at
2 least one vacuum port in the shaft wall adjacent to said opening, and
3 a second conduit extending along the shaft, said second conduit having a proximal
4 end for connection to a vacuum source and being in fluid communication with said at
5 least one vacuum port so that a vacuum can be drawn in the isolated portion of the
6 esophagus.

1 32. (Previously Presented) The apparatus defined in claim 31 and further including
2 additional vacuum ports in the shaft wall spaced above and below said at least one vac-
3 uum port, said second conduit also being in fluid communication with said additional
4 vacuum ports.

1 33. (Previously Presented) The apparatus defined in claim 29 and further including
2 a light source connected to the proximal end of the endoscope, and
3 an ultrasound transceiver connected to said conductors.

1 34. (Previously Presented) The apparatus defined in claim 29 and further including an
2 elongated probe or surgical device received in said first lumen, said probe or surgical de-
3 vice having a working end which is deployable from said opening.

1 35. (Currently Amended) Apparatus for ~~guiding an endoscope or a therapeutic device~~
2 ~~into a body cavity via the esophagus to conduct an observation or a therapeutic treatment~~
3 ~~in said body cavity~~ performing a transesophageal procedure, said apparatus comprising

4 | ~~an insertion section~~ a flexible access device which has a proximal end, a distal end
5 | and a central axis extending between said ends and which is capable of being inserted
6 | into ~~a body~~ the esophagus through the mouth, and
7 | a fixing device arranged in the vicinity of the distal end of the ~~guide tube~~ access
8 | device for fixing said distal end to a portion of the esophagus.

1 | 36. (Previously Presented) The apparatus defined in claim 35 wherein the fixing de-
2 | vice comprises a pair of flaps which clamp the esophagus portion therebetween.

1 | 37. (Previously Presented) The apparatus defined in claim 36 wherein the fixing de-
2 | vice comprises one or more inflatable balloons for engaging the esophagus portion.

1 | 38. (Currently Amended) The apparatus defined in claim 35 and further including a
2 | penetration device received in the ~~guide tube~~ access device, said penetration device hav-
3 | ing a distal end for projecting through the distal end of the guide tube for penetrating the
4 | esophagus portion at a selected penetration site.

1 | 39. (Currently Amended) The ~~guide tube~~ apparatus defined in claim 38 wherein the
2 | fixing device establishes a seal between the distal end of the penetration device and the
3 | esophagus portion around the penetration site.

1 | 40. (Previously Presented) The apparatus defined in claim 38 wherein the penetration
2 | device comprises a needle with an overlying dilator sheath.

1 | 41. (Currently Amended) A apparatus according to claim 35 wherein the ~~insertion~~
2 | ~~section~~ access device has an outer diameter of 5 to 10mm.

1 | 42. (Currently Amended) The ~~guide tube~~ apparatus according to claim 35 wherein the
2 | ~~insertion section~~ access device can be bent in at least one direction from said central axis.

1 43.-46. (Cancelled).
